

Minimum Intervention (MI) in Children – Review and Review until Cavitation?

Synopsis:

Thus far lectures in MI have not focused on children but amalgamated with MI in adults. Children are not small adults. Evidence has shown that topical fluorides in primary teeth are less effective than in adult teeth. Monitoring and diagnosis of the disease which we take for granted for adults often cannot be used in the very young child. Hence the title of this talk. I take a real-world view on using MI in children as it applies to our local population.

Registration Fees (w/GST)

SDA Member: S\$21.80

Non-SDA Member (OHT): S\$43.60

Non-SDA Member (Dentist): S\$65.40
